

## ***CIPRESSI RIFLESSI***

### ***ABSTRACT - ENG***

*The key elements of the environment were integrated: the natural landscape consisting of the typical Tuscan cypress tree, the urbanized context with its local community and the hut named after the Municipality of Capannoli. The toponym, mentioned in the Middle Ages as Capannule is a derivative of a hut in the sense of “casupola”. Five structural elements representing a series of stylized cypresses geometries are connected by a series of cables to form a hut that becomes a lightweight intervention in a site already rich in history and culture. The innovative aspect of this project lies in the construction method of the elements themselves, which can be manufactured with the new fidu technology without any waste production. The technology employs air inflation of the individual elements, thus being perfectly compliant with the environmental issues that concern us today.*
